## Control valves
G 41 ... and G 46 ...

Kv coefficient calculation

Calculation itself is carried out with respect to conditions of regulating circuit and operating medium according to equations mentioned below. Control valve must be designed to be able to regulate maximal flow quantity at given operating conditions. At the same time it is necessary to check whether minimal flow quantity can be even regulated or not.

Because of eventual minus tolerance 10% of Kv_{100} against Kvs and requirement for possible regulation within range of maximal flow (decrement and increase of flow), producer recommends to select Kvs value higher than maximal operating Kv value:

$$Kvs = 1.2 \div 1.3\ Kv$$

It is necessary to take into account to which extent Q_{max} involve "precautionary additions" that could result in valve oversizing.

Relations of Kv calculation

Kv =		Pressure drop $p_2 > p_1/2$ $\Delta p < p_1/2$	Pressure drop $\Delta p \geqq p_1/2$ $p_2 \leqq p_1/2$
	Liquid	$\dfrac{Q}{100}\sqrt{\dfrac{\rho_1}{\Delta p}}$	
	Gas	$\dfrac{Q_n}{5141}\sqrt{\dfrac{\rho_n \cdot T_1}{\Delta p \cdot p_2}}$	$\dfrac{2 \cdot Q_n}{5141 \cdot p_1}\sqrt{\rho_n \cdot T_1}$
	Superh. steam	$\dfrac{Q_m}{100}\sqrt{\dfrac{v_2}{\Delta p}}$	$\dfrac{Q_m}{100}\sqrt{\dfrac{2v}{p_1}}$
	Sat. steam	$\dfrac{Q_m}{100}\sqrt{\dfrac{v_2 \cdot x}{\Delta p}}$	$\dfrac{Q_m}{100}\sqrt{\dfrac{2v \cdot x}{p_1}}$

Above critical flow of vapours and gases

When pressure ratio is above critical ($p_2/p_1 < 0.54$), speed of flow reaches acoustic velocity at the narrowest section. This event can cause higher level of noisiness and then it is convenient to use a throttling system ensuring low noisiness (multi-step pressure reduction, damping orifice plate at outlet).

Cavitation

Cavitation is a phenomenon when there are steam bubbles creating and vanishing in shocks - generally at the narrowest section of flowing due to local pressure drop. This event expressively cuts down service life of inner parts and can result in creation of unpleasant vibrations and noisiness. In control valves it can happen on condition that

$$(p_1 - p_2) \geqq 0.6\ (p_1 - p_s)$$

Valve differential pressure should be set the way so that neither any undesired pressure drop causing cavitation can occur, nor liquid-steam(wet steam) mixture can create. Otherwise it must be taken into account when calculating Kv value. If the creation of cavitation still threatens, it is necessary to use a multi-step pressure reduction.

Valve flow characteristics
L - linear characteristic
$$Kv/Kv_{100} = 0.0183 + 0.9817 \cdot (H/H_{100})$$
R - equal-percentage characteristic (4-percentage)
$$Kv/Kv_{100} = 0.0183 \cdot E^{(4 \cdot H/H_{100})}$$

Dimensions and units

Marking	Unit	Name of dimension
Kv	m³/hour	Flow coefficient under conditions of units of flow
Kv_{100}	m³/hour	Flow coefficient at nominal stroke
Kvs	m³/hour	Valve nominal flow coefficient
Q	m³/hour	Flow rate in operating conditions (T_1, p_1)
Q_n	Nm³/hour	Flow rate in normal conditions (0 °C, 0.101 MPa)
Q_m	kg/hour	Flow rate in operating conditions (T_1, p_1)
p_1	MPa	Upstream absolute pressure
p_2	MPa	Downstream absolute pressure
p_s	MPa	Absolute pressure of saturated steam at given temperature (T_1)
Δp	MPa	Valve differential pressure ($\Delta p = p_1 - p_2$)
ρ_1	kg/m³	Process medium density in operating conditions (T_1, p_1)
ρ_n	kg/Nm³	Gas density in normal conditions (0 °C, 0.101 MPa)
v_2	m³/kg	Specific volume of steam when temperature T_1 and pressure p_2
v	m³/kg	Specific volume of steam when temperature T_1 and pressure $p_1/2$
T_1	K	Absolute temperature at valve inlet ($T_1 = 273 + t_1$)
x	1	Proportionate weight volume of saturated steam in wet steam

Diagram for the valve Kvs value specification according to the required flow rate of water Q and the valve differential pressure Δp
The diagram serves to specify the valve Kvs value regarding to the required flow rate of water at a given differential pressure. It can be also used for finding out the differential pressure value of the existing valve in behaviour with the flow rate. The diagram apllies to water with the density of 1000 kg/m³.

For the value $Q = q \cdot 10^n$, it is necessary to calculate with $Kvs = k \cdot 10^n$. Example: water flow rate of $16 \cdot 10^{-1} = 1,6$ m³/hour corresponds to $Kv = 2,5 = 25 \cdot 10$ when differential pressure 40kPa.

**Lever control valves
DN 40/100 and 65/150, PN 250/160**

Description

The valve is single-seated, lever-actuated, designed to be actuated with an electric actuator or a hydraulic cylinder. In case of manual operation, it is possible to lock the levers with an arresting pin and to actuate the valve with its hand wheel. The valve is equipped with a position indicator.

The control valves for temperatures exceeding 400 °C are equipped with a labyrinth packing with the drain off. The valve control plug is always designed for the parametres specified in the order and according to the requested type of flow characteristic.

The valve can be delivered with actuators of the following producers: ZPA Pečky - Modact MPS, Modact Control MPS and Modact Variant MPR. The connection stem between the valve´s lever and the actuator´s is not a subject of the delivery unless it is ordered.

Application

The valve serves as a control, reducing or by-pass element with indirect actuating. The max. permissible operating pressures acc. to EN 12 516-1 see page 19 of this catalogue. The intention to use the valve for higher temperatures must be agreed upon with the producer. The control valve´s proper function depends on the sizing and execution of the control station, therefore the valve design and its specification is recommended to be carried out together with the producer.

Process media

The valves are designed to regulate the flow and pressure of liquids, possibly vapours and gases such as water, steam and other media compatible with the material of the valve´s inner parts. The valve max. differential pressure is 4,0 MPa with respect to pressure nominal value and to concrete service conditions (ratio p_1 / p_2, creation of cavitation, above-critical flow etc.)

Installation

The valve can be piped only in a horizontal pipeline with vertically positioned stem and the valve´s lever above the valve body. The medium flow direction shall coincide with the arrows indicated on the valve body. The lever is mounted on the right side from the medium flow direction unless it is required otherwise. For control valves with an extended outlet, it is necessary to secure the outlet pipeline with a safety valve sized to the valve´s full output.

G 46 115 ...

Description

The valve is single-seated, lever-actuated, designed to be actuated with an electric actuator, possibly with an electric or a hydraulic cylinder. In case of emergency, it is possible for the valve equipped with hand wheel to lock the levers with an arresting pin and actuate the valve with its hand wheel. For sizes above DN 150, it is possible to use linear or rotative actuator. Its control plug is always designed according to the parameters specified in the order and according to the required type of flow characteristic.

The valves are supplied with the following actuators of the following producers: ZPA Pečky - Modact Konstant MPS, Modact Control MPS and Modact Variant MPR possibly with linear actuators ZPA Pečky, Regada Prešov and rotative actuators Auma or Schiebel. The connection stem between the valve lever and the actuator is not a subject of the delivery unless it is ordered.

Application

The valve serves as a control, reduction or by-pass element with indirect or direct actuating. The max. permissible pressures are according to EN 12 516-1 see page 19 of this catalogue. The intention to use the valve for higher temperatures must be agreed upon with the producer. The control valves proper function depends onthe sizing and execution of the control station, therefore the valve design and its specification is recommended to be carried out together with the producer.

Process media

The valves are designed to regulate the flow and pressure of liquids, possibly vapours and gases e.g. water, steam and other media compatible with material of the valve inner parts. The valve max. differential pressure is 4,0 MPa with respect to the pressure nominal and concrete conditions of operation (ratio p_1 / p_2, creation of cavitation, above critical flow etc.).

Installation

The valve can be piped only in a horizontal pipeline with vertically positioned stem and the valve lever positioned above the valve body. The medium flow direction shall coincide with the arrows indicated on the valve body. The lever is mounted on the right side from the medium flow direction unless it is required otherwise. For control valves with an extended outlet, it is necessary to secure the outlet pipeline with a safety valve sized to the control valve full output.

Modification for temperatures exceeding 400 °C

Control valves
DN 100/200 and 200/300, PN 100/64

Description

The valve is double-seated, lever-actuated, designed to be actuated with an electric actuator, possibly with a hydraulic or pneumatic cylinder. Its control plug is always designed according to the parametres specified in the order and according to the requested type of flow characteristic.

The valves are delivered with the folowing actuators of the followig producer: ZPA Pečky - Modact MPS, Modact Control MPS, Modact Variant MPR. The connection stem between the valve lever and the actuator is not a subject of delivery unless it is ordered.

Application

The valve serves as a control, reduction or by-pass element with direct or indirect actuating. The max. permissible operating pressures correspond to EN 12 516-1 see page No. 19 of this catalogue. The intention to use the valve for higher temperatures must be agreed upon with the producer. The valve proper function depends on the sizing and execution of the control station, therefore the valve design and its specification is recommended to be carried out together with the producer.

Process media

The valves are designed to regulate the flow and pressure of liquids, possibly vapours and gases e.g. water, steam and other media compatible with material of the valve inner parts. The valve max. differential pressure is 4,0 MPa with respect to the pressure nominal and concrete conditions of operation (ratio p_1 / p_2, creation of cavitation, above critical flow etc.).

Installation

The valve can be piped only in a horizontal pipeline with vertically positioned stem and the valve lever positioned above the valve body. The medium flow direction shall correspond to the arrows indicated on the valve body. The lever is mounted on the right side from the medium flow direction unless it is required otherwise. For control valves with an extended outlet, it is necessary to secure the outlet pipeline with a safety valve sized to the control valve full output.

Control valves
DN 65/150 to 300/400,
PN 100/25 to 100/100

Description

The valve is double-seated, lever-actuated, designed to be actuated with an electric actuator, possibly with a hydraulic or pneumatic cylinder. For sizes above DN 150, it is possible to use linear or rotative actuator. Its control plug is always designed according to the parametres specified in the order and according to the requested type of flow characteristic.

The valves are delivered with the folowing actuators of the followig producer: ZPA Pečky - Modact MPS, Modact Control MPS, Modact Variant MPR possibly with linear actuators ZPA Pečky, Regada Prešov and rotative actuators Auma or Schiebel. The connection stem between the valve lever and the actuator is not a subject of delivery unless it is ordered.

Application

The valve serves as a control, reduction or by-pass element with direct or indirect actuating. The max. operating permissible pressures correspond to ČSN 13 0010 see page No. 19 of this catalogue. The intention to use the valve for higher temperatures must be agreed upon with the producer. The control valve proper function depends on the sizing and execution of the control station, therefore the valve design and its specification is recommended to be carried out together with the producer.

Process media

The valves are designed to regulate the flow and pressure of liquids, possibly vapours and gases e.g. water, steam and other media compatible with material of the valve inner parts. The valve max. differential pressure is 4,0 MPa with respect to the pressure nominal and concrete conditions of operation (ratio p_1/p_2, creation of cavitation, above critical flow etc.).

Installation

The valve can be piped only in a horizontal pipeline with vertically positioned stem and the valve lever positioned above the valve body. The medium flow direction shall correspond to the arrows indicated on the valve body. The lever is mounted on the right side from the medium flow direction unless it is required otherwise. For control valves with an extended outlet, it is necessary to secure the outlet pipeline with a safety valve sized to the control valve full output.
Technical data

| Series	G 46 125 264	G 46 125 2100	G 46 125 5100
Type of valve	Control valves, double-seated, weld-ends, straight-through, with extended outlet
